"Characterization of cDNA encoding a human sperm membrane protein related to A4 amyloid protein.";

Proc. Natl. Acad. Sci. U.S.A. 87:2405-2408(1990).

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- ALTERNATIVE PRODUCTS: 4 ISOFORMS; A (SHOWN HERE), B, C AND D;

-RE PRODUCED BY ALTERNATIVE SPLICING.

-!- SIMILARITY: CONTALNS A PROTEASE INHIBITOR DOMAIN BELONGING TO THE BPTI/KUNITZ FAMILY OF INHIBITORS.

-!- SIMILARITY: BELONGS TO THE APP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                P15943;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.
Bikunin can be used to treat or prevent brain and spinal cord
Bedema, inflammation, infection or granulomatosis, multiple
sclerosis, ischaemia, perioperative blood loss, sepsis, shock,
fibrosis, blood coagulation diseases, polytrauma, stroke,
cerebral or subarachnoid haemorrhage and gastric or cervical
cerebral or subarachnoid haemorrhage and gastric or cervical
cancer and prevent metastasis. It is particularly useful for
reducing blood loss during surgery, and can also be used to treat
reducing blood loss during surgery, and can also be ded to treat
and the surgery and can also be used to treat
reducing blood loss during surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to approtinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing the cost of surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human placental bikunin - used to etc. in treatment of oedema, multiple perioperative blood loss

CC influenza and similar viral insulin dependent diabetes, caprothin, but is less highly charged so should be less to the reaction of similar properties to capout, and can be used to treat or prevent brain and factor XIIa. CC celerosis, inflammation, infection or granulomatosis, multiple cc fibrosis, blood coagulation diseases, polytrauma, stroke, cc fibrosis, blood coagulation diseases, polytrauma, stroke, cc cancer and prevent metastasis. It is particularly useful for cc cancer and grevent metastasis. It is particularly useful for cc dinfluenza and similar viral infections, acute pancreatitis and cc influenza and similar viral infections, acute pancreatitis and cc aprothini, but is less highly charged so should be less aprothini, but is less highly charged so should be less caprothini, but is less highly charged so should be less altered. It also reduces or eliminates the need for whole donor blood products during surgery, thereby reducing the risk co infection and other adverse side effects, as well as reducing the creation of infection and other adverse side effects, as well as reducing the control of the beautiful adverse side effects, as well as reducing the control of the control

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a human placental bikunin, which chinhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Simin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, multiple coedema, ischaemia, perioperative blood loss, sepsis, shock, coerebral or subarachnoid haemorrhage and gastric or cervical coerebral or subarachnoid haemorrhage and spitule or cervical coencer and prevent metastasis. It is particularly useful for councer and prevent metastasis. It is particularly useful for concer and prevent metastasis. It is particularly useful for concer and similar viral infections, acute pancreatitis and confiluenza and similar viral infections, acute pancreatitis and composition, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation cof infection and other adverse side effects, as well as reducing the risk cof the coefficient and other adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cother cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and influenza and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less aprotinin, but is less highly charged so should be less of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q
The present sequence is a consensus human bikunin, which contains the present sequence is a consensus human bikunin, which contains the present of prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple scherosis, ischaemia, perioperative blood loss, sepsis, shock, correbral or subcrachnoid haemorrhage and gastric or cervical correbral or subcrachnoid haemorrhage and gastric or cervical concer and prevent metastasis. It is particularly useful for cancer and prevent metastasis, in on-insulin dependent diabetes, of influenza and similar viral infections, acute pancreatitis and confirming and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plasmin; factor XIIa; treatment; prevention; oedema; inflammation; infection; granulomatosis; multiple sclerosis; ischaemia; perioperative blood loss; sepsis; shock; fibrosis; blood coagulation disease; polytrauma; stroke; haemorrhage; gastric cancer; cervical cancer; metastasis; blood loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W30060 standard: Protein; 235 AA.

It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to immunogenic and less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                     (FARB )

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a consensus human bikunin, which consider the present sequence is a consensus human bikunin, which limits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, carboris, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical concer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat cother cancer, arthritis, anaemia, non-insulin dependent diabetes, cinfluenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a human placental bikunin, which conhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, shock, creparal or subarachnoid haemorrhage and gastric or cervical career and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, confluenza and similar viral infections, acute pancreatitis and court, and prevent pre-term labour. It has similar properties to communogenic and less highly charged so should be less communogenic and cless likely to damage the kidneys Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor confluence the control of the c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence comprises a novel protein, designated HAI-II, that inhibits the protease activity of hepatocyte growth factor (HGE) activator. The sequence was deduced from a cDNA clone (T61439) obtained from cancer cell line MKN45. Also claimed HAI-II, a vector carrying this DNA, and a host cell, pref. an animal cell, transformed with the vector. HAI-II can be used for regulating HGF activator activity (and thus HGF activity) in vitro and in vivo. It may also be used for investigating the function of HAI-II in vivo and the effect of HAI-II in hepatic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 RWYFDVERNSCNNFIYGGCRGNKNSYRSEEACMLRCFRQQENPPLPLGSK 170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human tissue factor pathway
inhibitor-3 (TFPI-3) which contains two kunitz type domains. The
inhibitor-3 (TFPI-3) which contains two kunitz type domains. The
inhibitor-3 (TFPI-3) which contains two kunitz type domains. The
inhibitor-3 (TFPI-3) also provides the TFPI-3 cDNA and screening methods for
inhibitor-3 (TFPI-3) and screening methods for
inhibitor-3 (TFPI-3) and screening methods for
inhibitor-3 (TFPI-3) and inflammatory-3 (TFPI-3) are an anticoagulant in blood transfusions, extracorporeal circulation,
cut the TFPI-3 antagonists are claimed to be useful for TFPI-3 antagonists are claimed to be useful for coagulation, e.g. in the treatment of haemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 170;

The present sequence is a human placental bikunin, which control inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Control bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, perioperative blood loss, sepsis, shock, control in schaemia, perioperative blood loss, sepsis, shock, control in schaemia, perioperative blood loss, sepsis, shock, control in sepsial points, shock, control in sepsial points, sepsis, shock, control in sepsial points, and sepsial for treat control in sepsial points, and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to control in sequence may allow the inhibitory profile to be infection. It also reduces or eliminates the need for whole donor control in the blood products during surgery, thereby reducing the risk control in the sequence may allow the inhibitory profile to be control in the sequence may allow the subject of the blood products during surgery, thereby reducing the risk control in the sequence may allow the subject of the sequence of eliminates the need for whole donor allowed the control in the sequence of eliminates and sequence in the sequence of the sequence of eliminates and sequence in the sequence of the sequence of eliminates and sequence in the sequence in

The present sequence is a human placental bikunin, which control inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Colling inhibits, e.g. trypsin, kallikrein, plasmin and spinal cord codema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, shock, codema, inflammation, infection or granulomatosis, shock, codema, inflammation, perioperative blood loss, sepsis, shock, codema, inflammation diseases, polytrauma, stroke, codema, inflammation diseases, polytrauma, stroke, codembral or subarachnoid haemorrhage and gastric or cervical codemand codeman control in the case of the cancer, arthritis, anamia, non-insulin dependent diabetes, codemanuogenic and similar viral infections, acute pancreatitis and codeman codeman codeman and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to communogenic and less likely to damage the kidneys. Manipulation codeman codeman codeman allow the inhibitory profile to be of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor codeman codem

sclerosis, ischaemia, perioperative blood loss, sepsis, shock, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for other cancer, arthritis, anaemia, non-insulin dependent diabetes, gout, and prevent pre-term labour. It has similar properties to immunogenic and less likely to damage the kidneys. Manipulation and similar viral infections, acute pancreatitis and aprotinin, but is less highly charged so should be less of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor of infection and other adverse side effects, as well as reducing the risk the cost of surgery. The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple oedema, inflammation, infection or granulomatosis, sepsis, shock,

0,

The present sequence is a human placental bikunin, which can hisbits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, cerebral or subarachnoid heemorrhage and gastric or cervical concer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat confluenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to confluenza and less highly charged so should be less of immunogenic and less likely to damage the kidneys. Manipulation can blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

Patent No. 5589359
GENERAL INFORMATION:
APPLICANT: Innis, Michael
APPLICANT: Creasey, Abla
TITLE OF INVENTION: Chimeric Proteins
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSE: Chiron Corporation
STREET: 4560 Horton St.
                                                                                                                                     PRIOR APPLICATION DATA:
APPLICATION NUMBER: US/08/286,521
FILING DATE: 05-A0G-1994
ATTORNEY AGENT INFORMATION:
NAME: Savereide, Paul B.
REGISTRATION NUMBER: 36,914
REFERENCE/DOCKET NUMBER: 0990.001
TELEPROMINICATION SEO ID NO: 9:
SEQUENCE CHARACTERISTICS:
LENGTH: 276 amino acids
TENGTH: 276 amino acids

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 ADRERSIHDFCLVSKVVGRC.....ACMLRCFRQQENPPLPLGSK 170

A; Title: Purification and amino acid sequence of Kunitz-type protease inhibitor found A; Reference number: A26923; MUID:88007472
A; Accession: A26923
A; Accession: A26923
A; Molecule type: protein
A; Residues: 1-61 < NAK>
A; Residues: 1-61 < NAK>
A; Residues: 1-61 < NAK>
C; Comment: The inhibitory activity is similar to bovine basic proteinase inhibitor.
C; Superfamily: basic proteinase inhibitor; animal Kunitz-type proteinase inhibitor hord: Residues: animal Kunitz-type proteinase inhibitor hord: F; 8-58/Domain: Arginitation hord: Arginitation hord: F; 8-58/Domain: Arginitation hord: Arginitation hord: F; 8-58/Domain: Arginitation hord: Argin

A; Dayer inneveral source: in time NOBI backbone (NCBIP:107966)
A; Dayer inneveral source: in time
A; Note: sequence extracted from NCBI backbone (NCBIP:107966)
C; Comment: This inhibitory fragment, released from native ITI after limited proteouys
first domain interacts weakly with PNN-granulocytic elastase and not at all with panc
first domain interacts weakly with PNN-granulocytic elastase and not at all with panc
first domain: The amino acid at position ply.
C; Superfamily: protein HC; animal Kunitz-type proteinase inhibitor homology; lipocal;
C; Syporates: upplication; glycoprotein; plasma; serine proteinase inhibitor

N.Alternate names: extracellular protein 2

C.Species: Daucus carota (carrot)

C.Scerk, P. 301280

R.Sterk, P. 3077921, 1991

A.Title: Cell-specific expression of the carrot EP2 lipid transfer protein gene.

A.Title: Cell-specific expression of the carrot EP2 lipid transfer protein gene.

A.Recession: JQ1280

A.Molecule type: mRNA

A.Residues: 1-120 expression

A.Residues: 1-120 expression

C.Comment: This protein locates in cell walls.

C.Comment: This protein locates in cell walls.

C.Comment: The gene encoding for this protein is expressed in the embryogenic cell cultuce comment: The gene encoding for this protein

C.Superfamily: phospholipid transfer protein
